

SRD Series

[SRD-7(SB), SRD-6(SB)]

SRD-7(SB)

The most economical way to enjoy STAX electrostatic earspeakers. The SRD-7(SB) has two earspeaker jacks; the SRD-6(SB) has one. Both adaptors are designed to be connected to speaker terminals on a power amplifier or integrated amplifier. The selector knob lets you switch between ordinary speaker reproduction and earspeaker reproduction. High quality transformers are employed to ensure optimum sound quality. Refer to adaptor operating instruction booklets for connection details.

SRM-1/MK-2

This unit allows you to drive your earspeakers directly without an intermediate transformer/adaptor, for the ultimate in sound quality. Connects to output terminals — pre-out, or rec out — or directly to your tape deck, tuner or CDplayer, using ordinary cables (RCA pin plug). Permits connection of two earspeakers with complete volume control.

SRM-1/MK-2 Professional

The SRM-1/MK-2 Professional is a new version of the SRM-1/MK-2 with its high-biasing voltage circuit for the STAX Professional Earspeaker Series.

- (1) The left socket labeled "PRO ONLY" is an exclusive output for the Professional Series.
- (2) The right socket labeled "NORMAL" is to be connected with conventional Earspeakers.
- (3) Electret type Earspeakers requiring no external biasing voltage supply can be driven with either of the output sockets.
